## Oscillations

- **Natural Frequency:**  $\sqrt{\frac{k}{m}}$
- **Damping Ratio ( $\zeta$ ):**

$$\zeta = \frac{b}{b_c}$$

where  $b_c = 2\sqrt{mk}$

## Quality Factor (Q factor)

The Q factor is a dimensionless parameter that describes the damping of an oscillator. It represents the energy stored to energy dissipated ratio.

$$Q = \frac{1}{2\zeta} = \frac{\omega_0}{\Delta\omega} = 2\pi f \times \frac{\text{energy stored}}{\text{power loss}}$$

where  $\Delta\omega$  is the bandwidth over which the energy is stored.

## Types of Oscillations

- **Critically Damped** ( $\zeta = 1$ ): The system returns to equilibrium as quickly as possible without oscillating.
- **Overdamped** ( $\zeta > 1$ ): The system returns to equilibrium without oscillating but slower than the critically damped case.
- **Underdamped** ( $\zeta < 1$ ): The system oscillates about the equilibrium position with a frequency  $\omega_d$  given by:

$$\omega_d = \omega_0 \sqrt{1 - \zeta^2}$$

## Thermodynamics

**0th law:** If two objects are in thermal equilibrium with a third object, then all three objects are in thermal equilibrium with each other.

**1st law:** For any process concerning a given system, the change in internal energy  $\Delta U$  of that system is equal to the sum of the heat  $Q$  transferred to that system and the work  $W$  performed on that system.

**2nd law:**

- **Carnot:** Wherever there exists a difference in temperature, motive power can be produced.
- **Kelvin:** It is impossible for a self-acting machine to convey heat from a colder body to a hotter one.
- **Clausius:** Heat cannot flow from a colder to a hotter body without another process occurring, connected therewith, simultaneously.

For a driven damped harmonic oscillator, the general solution can be expressed as:
